

# MULTI-FLEX CONVEYORS

The Versatile Alpine Conveying System  
Can be Designed as an Accumulator and Elevator.

Nercon has designed Multi-Flex Conveying Systems for a variety of industries. Multi-Flex Conveyors provide three dimensional product handling. In addition, the small side flex radius of the Multi-Flex chain permits compact conveyor construction.

Multi-Flex chain with its' unique knuckle hinge arrangement provides extra strength compared to conventional table top chain, as well as the ability to flex in multiple directions.

Applications include: Conveying between floors, In-line processing for heating and cooling, Overhead conveying to open up floor space, Routing to and from automatic or manual inspection stations.

Longer runs with a single drive are possible since chain is used in conjunction with anti-friction turn discs, a combination that prevents chain tension build-up.

## Multi-Flex Conveying Systems offer Maximum Versatility

Compact side flex radius and low profile allow product to go around or through machinery without transfers.

Corner disc guides chain around curve without significant increase in chain tension. Disc can be provided in plastic or cast aluminum.

Automatic or manual inspection loops are one Multi-Flex application.
